

# 1 Chapter 2: Exercises

1. Give explicit formulae for the Fourier coefficients  $c_k$  and approximate Fourier coefficients  $\tilde{c}_k^n$  for the following functions:

$$\cos x, \frac{3}{3 - e^{ix}}$$

Hint: You may wish to try the change of variables  $z = e^{ix}$ .

2. Show that the DFT  $Q_n$  is symmetric ( $Q_n = Q_n^\top$ ) but not Hermitian ( $Q_n \neq \check{Q}_n^*$ ).
3. Show that

$$\sum_{k=-m}^m e^{ikx} = \begin{cases} \frac{\sin((m+1/2)x)}{\sin(x/2)} & \text{if } x \neq 0 \\ 2m+1 & \text{if } x = 0 \end{cases}$$

4. Prove that the trigonometric interpolant  $p_n(x)$  that interpolates  $f$  at  $x = x_j = jh$ ,  $j = 0, \dots, n-1$  with  $h = 2\pi/n$  and  $n = 2m+1$  is unique.
5. Consider the advection equation

$$u_t + u_x = 0, \quad x \in [0, 2\pi), \quad t \in [0, T],$$

with  $u(x, 0) = f(x) = e^{-100(x-1)^2}$  and exact solution  $u(x, t) = f(x - t)$ ; also consider (i) the forward-difference-Fourier method

$$\mathbf{u}^{i+1} = \mathbf{u}^i - \tau \mathcal{F}^{-1} \left\{ \mathbf{i}(-m:m) \cdot \mathcal{F}\{\mathbf{u}^i\} \right\}, \quad i = 0, \dots, n_t - 1$$

and (ii) the central-difference-Fourier method (aka the leapfrog method)

$$\mathbf{u}^{i+1} = \mathbf{u}^{i-1} - 2\tau \mathcal{F}^{-1} \left\{ \mathbf{i}(-m:m) \cdot \mathcal{F}\{\mathbf{u}^i\} \right\}, \quad i = 1, \dots, n_t - 1.$$

For the leapfrog method, set  $u_j^1 = f(x_j - \tau)$ . For both methods, set  $n_x = 401$ ,  $n_t = 500$  and  $T = 1.05$  and plot the maximum error for each time step, i.e., plot

$$e_i := \max_{j=0, \dots, n_x-1} |u(x_j, t_i) - u_j^i|$$

for  $i = 1, \dots, n_t$ . Describe the behaviour of  $e_i$  for each method.
